PC-7® Epoxy Paste

Directions:
Using separate knives (remove amount needed from cans), mix equal parts of A (lt. gray) and B (black) until uniform in color. Surfaces to be bonded must be free of dirt, oil, rust, etc. At 21°C (70°F) PC-7® will remain workable for one hour and cures for service overnight. Do not subject to sustained heat in excess of 93°C (200°F).

Mixing Tips:
In cool temperatures, place PC-7® containers near heat to insure easier mixing. Any smooth surface is good for mixing on. Simple 1:1 mix.

Since mixing and use of this product is beyond our control we accept no liability other than refund or replacement due to product defect only.

* Cure is faster at higher temperatures, and slower at cooler temperatures.
